Loaders can preprocess files at compile time, such as TypeScript to JavaScript, Handlebars strings to compiled functions, images to Base64, etc. e. In this case, when you write a loader, you don't have to worry about how it will process the file and what format it will use (for example, if it's a string, will it be converted to something that can be read from a stream, or if it's an image, will it be recognized as binary or whatever). So you can write a loader that takes care of how to load it, and then just write a compile function that outputs the loaded file.
