A: You have found a Debug Flag, which should result in a Trojan. In short, there is a piece of code with the name DEBUGGER\_OPTIONS that contains a switch. If set it will launch a program called TaskMGR.exe with the parameters C:\TROJAN. The sample you have provided is the opposite of the switch. It isn't set, so you shouldn't see this behavior. The easiest way to clear out the variable is to reboot the computer into safe mode. If you can't do that, shutdown the computer, boot in to safe mode and clear out the variable. Since you are infected by a trojan, it is very important you clean up your system. Q: Return only one row from a table I have this code var results = from table in sosDBEntities.Users.OfType() join t in sosDBEntities.Users.OfType() on table.Id equals t.Id select table; return View(results.ToList()); If sosDBEntities.Users.OfType() returns 2 or more rows it gives The model item passed into the view is of type 'System.Data.Objects.ObjectQuery`1[Models.User]', but this view expected the model item passed into the view to be of type 'System.Data.Entity.DynamicProxies.User\_9CE99E6E71BFBABFB8A2BBA8CB5AB617A105EF5950C70C99C3E05C49C163534D9'. How can I get it to only return 1 row? A: After joining the table with itself, you need to select the original table and assign that to results var results = from table in sosDBEntities.Users e79caf774b

I'm using a shared wifi hotspot at an institute, and I need to download the drivers (but I can't use my Internet) to be able to use my internet for almost 4 hours and use the Internet safely throughout the day (since it's for school work). Is there a way to download the drivers offline, in order to use them offline? What is the best idea? How can I download all the drivers? Are there any hacking programs that download drivers? P.S. I'm using Windows 7 Home Premium, 64 bit. Thank you in advance, G. A: You can download the drivers and then install them. However, this will install the drivers for all the network interfaces that are configured in your system, not just the one you need. Also, this is not practical in this case - you need to be online for the drivers to update. Otherwise, you can use a software for network sharing called UPnP. Although this will only allow you to download the drivers you need. The software should work on Windows 7 and above. { "name": "oneup-easy-extends", "description": "Oneup Easy Extend Plugin for Gutenberg.", "homepage": "", "keywords": ["gutenberg", "wp", "plugins"], "authors": [ { "name": "Naveen", "email": "naveendh@gmail.com" } ], "license": "GPL-3.0+", "require": { "php": ">=5.2", "graham-campbell/package-version-locker": "^1.0" }, "require-dev": { "phpunit/phpunit": "~3.7.9" }, "autoload": {
