11.5.0.3 SerialÂ .High-resolution,  
asymmetric medium resolution ion mobility  
spectrometry to determine neutral isomers:  
Application to cationized DNA oligomers.  
Here we describe an analysis of the high-  
resolution, asymmetric-field-enabled, ion  
mobility spectrometry (FAIMS-H-FAIMS) and  
medium-resolution FAIMS (FAIMS-M) spectra  
of a series of long DNA oligonucleotides  
possessing one or two positively charged  
amine groups. The ions' FAIMS spectra  
contain no peaks related to deprotonated  
DNA or cationized DNA oligomers. The FAIMS-  
M spectrum of cationized DNA oligomers  
peaks corresponding to the cationized DNA  
oligomers, the matching peaks in the FAIMS-  
H-FAIMS spectrum of cationized DNA  
oligomers correspond to the neutral isomers.

---

The FAIMS spectra of DNA oligomers dually and triply cationized all contain peaks corresponding to the deprotonated DNA oligomers, which is consistent with the N-1 charge-state distribution. We were able to determine the abundance of the N-1, N-2 and N-3 deprotonated DNA oligomers for a triply cationized DNA and the N-1 deprotonated DNA oligomers for a dual cationized DNA. The FAIMS spectra of DNA oligomers singly and dually cationized show additional peaks not observed in the FAIMS spectra of their corresponding N-2 deprotonated DNA oligomers. We show that these additional peaks are related to deprotonated species of DNA that have both a hydrogen-bonded base and a protonated base (e.g., DNA: A-N3H+H). A radical-mediated deprotonation of a protonated base occurs to yield a nucleobase that remains bound to the backbone, and a nascent radical that migrates away from the backbone. The FAIMS spectra of nucleobases are similar to the FAIMS spect
