This lesson will show you the basics of working with Photoshop layers, how to use the Edit | Transform | Warp command, and how to create a new layer.

What is Layers? Photoshop works with layers. You can think of a layer as a shadowbox in which you are placing objects on it. It has properties like position, size, outline color, and shadowing. Layers are the visual structure of an image — every object, picture, or photo is separated into layers. Objects on a layer become visible once the layer is selected. To create a new layer, go to the Layer | New Layer menu. The Layer | New Layer menu is similar to the Layer menu on the left. Note: Only the top layer is visible in the

following screenshots as each layer has a different appearance. Click on the New Layer icon to create a new layer. The Image | New Layer menu is similar to the Layer | New Layer menu. The Size and Position controls appear on the Layers palette. These are handy for moving the position of an object on the layer in the image and for resizing the object. The Layers palette with a red arrow showing the new layer you just created. You can select different objects on the new layer or move existing objects to different places. The Layers palette with a blue arrow showing the new layer you just created. You can resize the object and move it to different areas of the image. Note: You can also drag a selected object to a new layer. In this lesson, however, we will cover creating a new layer by using the New Layer option. Let's Edit: Add a Background To get started with our lesson, you will add a layer to our picture and edit it by coloring the frame. Let's begin with a new background layer. To do this, go to the Layer | New Layer menu and click on the button to add a new layer. The Layer | New Layer menu is similar to the Layer | New Layer menu. Create a new layer for the

background of our frame. The new layer is given a blue outline. The Layer | New Layer menu is similar to the Layer | New Layer menu. Click on the Create New Layer button to add the new layer. The Layer

Just like Photoshop, Photoshop Elements is a non-linear editor and an indispensable tool for image editing. You can make changes to your image in many places, and then save the image to some format. The author of this article use PSD to illustrate the steps in editing a photo in Photoshop. The primary differences between Photoshop and Photoshop Elements are: Adobe Photoshop Adobe Photoshop Elements Adobe Photoshop Adobe Photoshop Elements Adobe Photoshop Adobe Photoshop Elements Adobe Photoshop Adobe Photoshop Elements When using Photoshop, you can edit your photo using the Develop Module or the Adjust Module. In the Develop Module, you can adjust and create different layers and masks from the image. You can use the Adjust Module to adjust the

Q: Trouble with Parent/Child relationship in sqlite in android I would like to make a master table in sqlite database with a "parent" field pointing to the "id" of a child table. I tried with create table links (parent varchar primary key, child varchar, foreign key (parent) references "2.links" (id)); But when I run my application I get

android.database.sqlite.SQLiteException: near ".":
syntax error (code 1):, while compiling: create table
links (parent varchar primary key, child varchar,
foreign key (parent) references "2.links" (id))

(pointing to the parent) A: Short story: You need to be explicit about foreign key constraints. If you don't, the DB is going to assume the constraint exists, and will then create the table with the constraint.

Longer explanation: It seems like you want a table links, and a table links_parent. The first column would contain the "ID" of the second table, a foreign key. create table links (parent varchar primary key, child varchar, foreign key (parent) references

links_parent (id)) The second table links_parent would contain the information about the parent. In this case, the columns would include the value of the parent from the first table, and the value of the id (from the second table) from that row: create table links_parent (parent_id varchar, id int, primary key (parent_id, id), foreign key (parent_id) references links (parent)); There is one piece to the puzzle, the content of each row in a table. A constraint requires a column value. If you just want a "foreign key", you can skip that constraint entirely: create table links (parent varchar, child varchar, foreign key (parent) references links_parent (id), primary key (parent)); We

Q: "Я не нужен, ибо я хочу сделать компанию моей". - правильно ли данное предложение? Меня интересует, подскажите, правильно ли поставлено запятую перед ней, т.е. правильно ли получилось: Я не нужен, ибо я хочу сделать компанию моей.

A: Правильно и неправильно. Автор строки не

видит причины этому (запятая действительно
внутри слова "ибо") и вполне логично, что он
пытается сказать, что по крайней мере в силу
одинокчества полностью не нужно резать себя друг
другом - ◆
