I have been searching for weeks looking at example startup files and what not and cant seem to get it to work on my own network. Im using a FreeNAS Server called "Supermicro NAS MD1000". Its a Small sized network server that costs \$159 USD and allows for 25gbs of storage and has 6 usb ports for easy installation and sync of peripherals. I have gotten other external hard drives to work just fine. I have to have a network attached via Cat5 (if im using a Crossover cable i have to have the cable connected to each side of the Cat5 and do not cut the green wire when connecting). I have flashed the unit with freebsd, fedora and openSUSE and can still push 20 images or so. My problem is that when i connect the HardDrive that needs to be flashed, the drive goes to BUSY and nothing else happens and doesnt even connect via lsusb. I am able to get on the router via pppoe and have the unit connected to the router via cat5. Everything works fine as far as allowing networked access and connecting peripherals. My router is a Netgear WNDR3400v4. I have built a custom firmware based on OpenFirmware called "FreeNAS-PXE-MD1000". I have also gone through the files on the firmware page and wrote a script to get things working "HA.sh". I have swapped my hard drive from my running system to the one that im flashing and try to boot with the hard drive flash drive but that doesnt work either. Ive looked at the command line options for the boot command and what not and also tried different modifivations. I cant seem to get any of this to work. Does anyone know anything about Netbooting in FreeNAS or know any tricks or alternative methods to Netbooting. I would very much appreciate any help!

Casper 8 Startup Disc (Boot CD) Download Pc

i am trying to find out if someone has found a way to boot from a live usb flash drive (bootable drive) with the version of ubuntu 16.04.3lts. this is what i have done so far. i have downloaded the latest update to version 2.3 and the file is casper-v2.3.iso. i have created a live usb flash drive using the syslinux installation program and the flash drive is fine. in fact the drive is a bootable drive and boots from the flash drive correctly. i have booted from the live usb flash drive on the computer. the computer boots to the live usb flash drive but no matter what i do the computer does not boot from the bootable drive. i have tried to create a bootable drive on a different usb flash drive but the computer still boots to the hard drive only. i cannot get the computer to boot from the bootable drive. i have tried various usb flash drives and have found out that if i install the bootable drive to a flash drive with the size of 2 gb or smaller it will boot from the flash drive. if i try to install the bootable drive to a flash drive with the size of 4 gb or more the computer will not boot to the flash drive. the option key is sometimes used to speed up the mac startup process. you should hold down the option key during startup. if you are not using the option key, hold down the command key, and then press and release the space key. the internet download manager idm 6.19 build 8 final crack-p2p setup free is a fast download and management solution for downloading videos and other files with a minimal of data loss. when you need the idm to download your favorite online videos and other files, you can try the idm with the crack version. the crack version of the idm can not only be used to download files, but also to configure the settings that you want to make for the program. the idm 6.19 build 8 final crack-p2p setup free is a program for download videos and other files online.
