Jim Dalio, chief technologist, Adobe, commented that AI brings the power of machine learning to the desktop applications. Although it has been around since version 3.0, many users don't even bother to use it. As well as being a lot like regular Photoshop filters, you can use it to create all sorts of cool lights and shades, like drops, haze, vignettes, and more, from a set of built-in presets. In the past, websites could be made with just HTML and CSS alone. However, with the wide popularity of mobile devices and delivery systems, and the high

percentage of users accessing websites directly from a mobile device, developers have turned more to frameworks to speed up development. As a way of making websites increasingly more mobile-responsive, these frameworks and template engines are now more widely used than ever and they have simplified the process of creating websites. "You can create one-page websites quickly and easily with just plain HTML and CSS." The "plain" refers to how the page elements are separated and structured and this is what allows it to be used as a base template which is then extended and modified to fit various needs. It's also how sections known as "areas" are created. They can be defined and created on both parent or sub-pages as well as at a dynamic level. The CSS is defined for various parts like the color, border, and content, and the areas can be merged and defined for each different section on the page. That's just the basics of programming with CSS and HTML. From there, the content is not only angled but designed as well. Even functions are included and tested in a debug build. Even though not all web developer's have a need for a one-page site, most agree that it's simply a great template for mobile optimized websites. It also reduces the hassles of having to think about a site which could be huge. This frees you up for something else. In addition to that, it is a very good solution for those who are not web designers, or who are having difficulty using more advanced web technology like HTML or Javascript. For a novice user it's super easy to use and it provides all the essential functionality except for the front-end. It even allows you to define different sections of content (like the header, footer, sidebar, navigation and content) for each page. The content is also managed at a template level and the template level can be applied to sub-pages, even merging them together to create a one-page site.
